Ethics in Technology Tabletop Workshop with Palantir

The most important institutions in the world don't just protect public safety or provide vital goods and services — they also deal with astonishing amounts of data. At Palantir, we build software that lets these organizations safely integrate and analyze their data to combat terrorism, uncover fraud, develop new medicines, build safer airplanes, and more.

Can you save the lives of 10,000 people without jeopardizing the freedoms of 100,000? This just one of the many ethical dilemmas that confront the engineers creating the technology that reshapes our society. Join engineers from Palantir Technologies' Privacy and Civil Liberties Engineering team for an interactive "Tabletop Exercise" that challenges you to chart an ethical course in an increasingly complex world.
